Table of Contents

25 m Flat Irrigation Hose

28 straps 2,5× 100 mm

24 ground locking pins

4 hose/hose couplings

10 barbed hose couplings

10 end stops

Use

The Soaker Hose can be cut to any length.

The length of hose then needs BOTH an end stop and a barbed hose coupling (which connects to the main water supply hose) to work.

Both are installed in the same way:

1. Open the irrigation hose

2. Push the connector of the end stop or barbed hose connector

3. Push up to the flange on the coupling and tie the strap firmly around

4. Pull tight, cut off if necessary

5. The barbed hose connector can then be connected to the main water supply hose

6. Complete couplings

How to use (continued)

Lay a length of irrigation hose on the ground as far as possible, following the contours if necessary.

Use plastic pins for fixing.

Care must be taken to avoid damaging the soaker hose during gardening. If necessary, remove any mulch cover before gardening.

The hose can be left in place over the winter.

If required, two lengths of hose can be connected using the Hose/Hose Coupling, following the same procedure as above.
